SAT Problem

$$z = \frac{x-\mu}{\sigma}$$

Among all applicants to a certain university one year, the Math SAT scores averaged 535, the SD was 100, and the scores followed the normal curve. Estimate the 95th percentile of the score distribution.

$$z_{.95} = 1.645$$

$$x = \mu + z\sigma = 535 + 1.645 \times 100$$

$$\approx 700$$
